classList

What is classList?

If you have written any JavaScript then you have almost certainly used classList at least once. You may even think that classList is as simple as an add and remove method, but there is so much more to classList. In this article I want to show you the basics of using classList.

The most basic usage of classList is adding and removing classes. When you access the classList of an element you can use the add method to add a class and the remove method to remove a class. You can pass as **many** classes as you want to these methods and they will add/remove them all. You can also access the string of all classes by using the value property.

```
element.classList.add('new-class', 'another-class')  
console.log(element.classList.value)  
// new-class another-class
```

```
element.classList.remove('another-class')  
console.log(element.classList.value)  
// new-class
```
